

FENDER BRACKETS

Abstract of the Disclosure

A bracket for supporting a fender of a motorcycle can be configured such that a larger tire can be accommodated. For example, the fender bracket can be shaped so as to laterally offset the fender from its original position so that a larger tire can be mounted to the motorcycle and received within the fender. The fender bracket can be included in a kit for replacing the original fender brackets of a motorcycle so as to offset the fender from its original position. Additionally, the kit can include adjustment members for use with original mounting apertures provided on the motorcycle frame so as to allow the fender brackets to be adjusted.
